front

rear

Using a rule and a pin / needle or similar, scribe along all of the lines marked with black "Drawing Pin" symbols and those of the fixing tabs. On the line marked with red "Drawing Pin" symbols just scribe along the black line and not across the side walls of the a/c unit. Then carefully cut out all 12 pieces. Cut the slits on the front part only so far as to leave 5mm in the centre as uncut. On the centre part of the floor panel bend the fixing tabs upwards and the wheels downwards.

Next, glue the front to one of the sides ideally starting with the centre tab, then the lower and lastly the upper tab. Then attach the roof panel to the side panel and afterwards to the front panel. Glue the air conditioning unit together firstly and then fix it to the roof panel in the pre-marked area. Now glue the other side panel to the roof and front panels. Glue the rear panel firstly to the roof and then to the side panels. Of the 3 floor panels, glue firstly the front and rear parts and lastly the centre part.  
 TIP! Glue the tyre tabs lastly as they can be used to adjust the position of the floor panel until it's correctly in place.  
 Fold and glue the mirror arms and then bend the mirror glasses to at right angles to the mirror arms. Glue mirrors to the side panels using the white areas above the side windows.  
 Have a nice flight.
